## Multivariate Optimization

Optimizing multivariate functions

- Parameters  $\boldsymbol{\beta} = (\beta_1, \beta_2, \dots, \beta_n)$  such that  $f(\boldsymbol{\beta}|\boldsymbol{X}, \boldsymbol{Y})$  is maximized
- Policy  $\mathbf{x} \in \Re^n$  that maximizes  $U(\mathbf{x})$
- Weights  $\pi = (\pi_1, \pi_2, \dots, \pi_K)$  such that a weighted average of forecasts  $\mathbf{f} = (f_1, f_2, \dots, f_k)$  have minimum loss

$$\min_{\pi} = -(\sum_{j=1}^{K} \pi_j f_j - y)^2$$

Today we'll describe analytic and computational approaches to optimization

- Analytic recipe for optimization
- Computational optimization
  - Multivariate Newton-Raphson
  - BFGS
  - Approximate Optimization: k-means

## Multivariate Optimization

### Definition

Let  $\mathbf{x} \in \mathbb{R}^n$  and let  $\delta > 0$ . Define a neighborhood of  $\mathbf{x}$ ,  $B(\mathbf{x}, \delta)$ , as the set of points such that,

$$B(\mathbf{x}, \delta) = \{\mathbf{y} \in \Re^n : ||\mathbf{x} - \mathbf{y}|| < \delta\}$$

#### Definition

Suppose  $f: X \to \Re$  with  $X \subset \Re^n$ . A vector  $\mathbf{x}^* \in X$  is a global maximum if , for all other  $\mathbf{x} \in X$ 

$$f(\mathbf{x}^*) > f(\mathbf{x})$$

A vector  $\mathbf{x}^{local}$  is a local maximum if there is a neighborhood around  $\mathbf{x}^{local}$ ,  $Q \subset X$  such that, for all  $x \in Q$ ,

$$f(\mathbf{x}^{local}) > f(\mathbf{x})$$

### Multivariate Optimization

#### Definition

A set  $X \subset \mathbb{R}^n$  is compact if it is closed and bounded

#### Theorem

Multivariate Extreme Value Theorem Suppose  $f: X \to \Re$  be continuous and  $X \subset \Re^n$  and X compact. Then f takes on its maximum and minimum values on X.

We're going to come up with the multivariate equivalent of the first order and second order conditions now

### Gradient

### Definition

Suppose  $f: X \to \mathbb{R}^n$  with  $X \subset \mathbb{R}^1$  is a differentiable function. Define the gradient vector of f at  $\mathbf{x}_0$ ,  $\nabla f(\mathbf{x}_0)$  as,

$$\nabla f(\mathbf{x}_0) = \left(\frac{\partial f(\mathbf{x}_0)}{\partial x_1}, \frac{\partial f(\mathbf{x}_0)}{\partial x_2}, \frac{\partial f(\mathbf{x}_0)}{\partial x_3}, \dots, \frac{\partial f(\mathbf{x}_0)}{\partial x_n}\right)$$

### Gradient First Order Condition

#### Theorem

Suppose  $f: X \to \Re^1$ ,  $X \subset \Re^n$ . Suppose  $\mathbf{a} \in X$  is a local extremum. Then,

$$\nabla f(\mathbf{a}) = \mathbf{0}$$
$$= (0, 0, \dots, 0)$$

- Proof (intuition): same as one dimensional case (left-hand, right hand), just do it dimension by dimension
- Critical Values:
  - 1) Maximum
  - 2) Minimum
  - 3) Saddle point
- Second Derivative Test!

### Second Order Conditions: Hessian

#### Definition

Suppose  $f: X \to \Re^1$ ,  $X \subset \Re^n$ , with f a twice differentiable function. We will define the Hessian matrix as the matrix of second derivatives at  $\mathbf{x}^* \in X$ ,

$$\boldsymbol{H}(f)(\boldsymbol{x}^*) = \begin{pmatrix} \frac{\partial^2 f}{\partial x_1 \partial x_1}(\boldsymbol{x}^*) & \frac{\partial^2 f}{\partial x_1 \partial x_2}(\boldsymbol{x}^*) & \dots & \frac{\partial^2 f}{\partial x_1 \partial x_n}(\boldsymbol{x}^*) \\ \frac{\partial^2 f}{\partial x_2 \partial x_1}(\boldsymbol{x}^*) & \frac{\partial^2 f}{\partial x_2 \partial x_2}(\boldsymbol{x}^*) & \dots & \frac{\partial^2 f}{\partial x_2 \partial x_n}(\boldsymbol{x}^*) \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial^2 f}{\partial x_n \partial x_1}(\boldsymbol{x}^*) & \frac{\partial^2 f}{\partial x_n \partial x_2}(\boldsymbol{x}^*) & \dots & \frac{\partial^2 f}{\partial x_n \partial x_n}(\boldsymbol{x}^*) \end{pmatrix}$$

General test → Two Dimensional Test → Example

### Hessians

### Definition

Consider  $n \times n$  matrix **A**. If, for all  $\mathbf{x} \in \mathbb{R}^n$  where  $\mathbf{x} \neq 0$ :

x'Ax > 0 A is positive definite x'Ax < 0 A is negative definite

If  $\mathbf{x}' \mathbf{A} \mathbf{x} > 0$  for some  $\mathbf{x}$  and  $\mathbf{x}' \mathbf{A} \mathbf{x} < 0$  for other  $\mathbf{x}$ , then we say  $\mathbf{A}$  is indefinite

## Approximating functions and second order conditions

#### Theorem

**Taylor's Theorem** Suppose  $f: \Re \to \Re$ , f(x) is infinitely differentiable function. Then, the taylor expansion of f(x) around a is given by

$$f(x) = f(a) + \frac{f'(a)}{1!}(x-a) + \frac{f''(a)}{2!}(x-a)^2 + \frac{f'''(a)}{3!}(x-a)^3 + \dots$$
  
$$f(x) = \sum_{n=0}^{\infty} \frac{f^n(a)}{n!}(x-a)^n$$

## **Example Function**

Suppose a = 0 and  $f(x) = e^x$ . Then,

$$f'(x) = e^{x}$$

$$f''(x) = e^{x}$$

$$\vdots \vdots \vdots$$

$$f^{n}(x) = e^{x}$$

This implies

$$e^{x} = 1 + x + \frac{x^{2}}{2!} + \frac{x^{3}}{3!} + \dots + \frac{x^{n}}{n!} + \dots$$

## Multivariate Taylor's Theorem

#### Theorem

Suppose  $f: \Re^n \to \Re$  is a three-times continously differentiable function, then around  $\mathbf{a} \in \Re^n$ ,

$$f(x) = f(a) + \nabla f(a)(x - a) + \frac{1}{2}(x - a)' H(f)(a)(x - a) + R(a, x)$$

where 
$$\frac{R(\pmb{x},\pmb{a})}{||\pmb{x}-\pmb{a}||^2} \to 0$$
 as  $\pmb{x} \to \pmb{a}$ 

### Intuition for Quadratic Form

Suppose  $x^*$  is some critical value,

$$f(x) = f(x^*) + \nabla f(x^*)(x - x^*) + (x - \frac{1}{2}x^*)H(f)(x^*)(x - x^*) + R(x^*, x^*)$$

$$f(x) - f(x^*) = 0(x - x^*) + (x - \frac{1}{2}x^*)H(f)(x^*)(x - x^*) + R(x^*, x)$$

For  $\mathbf{x}$  near  $\mathbf{x}^*$ ,  $R(\mathbf{x}^*, \mathbf{x}) \approx 0$ 

 $m{H}(f)(m{x}^*)$  positive definite  $o f(m{x}) > f(m{x}^*) o ext{local minimum}$  $m{H}(f)(m{x}^*)$  negative definite  $o f(m{x}) < f(m{x}^*) o ext{local maximum}$ 

#### Theorem

#### Second Derivative Test

- If H(f)(a) is positive definite then a is a local minimum
- If H(f)(a) is negative definite then a is a local maximum
- If H(f)(a) is indefinite then a is a saddle point

### Second Derivative Test

Many ways to assess definiteness → use determinant

#### Theorem

Two Dimensional, Second Derivative Test. Suppose  $f: X \to \Re$  with  $X \subset \Re^2$  and f twice differentiable. Write the Hessian of f at a critical value  $\mathbf{a}$ ,

$$\mathbf{H}(f)(\mathbf{a}) = \begin{pmatrix} A & B \\ B & C \end{pmatrix}$$

Then, we can conduct the second derivative test as:

- $AC B^2 > 0$  and  $A > 0 \rightsquigarrow$  positive definite  $\rightsquigarrow$  **a** is a local minimum
- $AC B^2 > 0$  and  $A < 0 \rightsquigarrow$  negative definite  $\rightsquigarrow$  **a** is a local maximum
- $AC B^2 < 0 \rightsquigarrow indefinite \rightsquigarrow saddle point$
- $AC B^2 = 0$  inconclusive

## Multivariate Recipe

- 1) Calculate gradient
- 2) Set equal to zero, solve system of equations
- 3) Calculate Hessian
- 4) Assess Hessian at critical values
- 5) Boundary values? (if relevant)

## Example 1: A Simple Optimization Problem

Suppose  $f: \Re^2 \to \Re$  with

$$f(x_1,x_2) = 3(x_1+2)^2 + 4(x_2+4)^2$$

Calculate gradient

$$\nabla f(\mathbf{x}) = (6x_1 + 12, 8x_2 + 32)$$
  
 $\mathbf{0} = (6x_1^* + 12, 8x_2^* + 32)$ 

We now solve the system of equations to yield  $x_1^st=-2$  and  $x_2^st=-4$ 

## Example 1: A Simple Optimization Problem

$$\mathbf{H}(f)(\mathbf{x}^*) = \begin{pmatrix} 6 & 0 \\ 0 & 8 \end{pmatrix}$$

 $det(\mathbf{H}(f)(\mathbf{x}^*)) = 48$  and 6 > 0 so  $\mathbf{H}(f)(\mathbf{x}^*)$  is positive definite. local minimum

### Example 2: Two Dimensional Ideal Points

Suppose legislators are considering legislation  $\mathbf{x} \in \mathbb{R}^2$ . And suppose legislator i has utility function  $U_i : \mathbb{R}^2 \to \mathbb{R}$ ,

$$U(\mathbf{x})_i = -(x_1 - \mu_1)^2 - (x_2 - \mu_2)^2$$

What is legislator i's optimal policy?

$$\nabla f(\mathbf{x}) = (-2(x_1 - \mu_1), -2(x_2 - \mu_2))$$
  
 $\nabla f(\mathbf{x}) = \mathbf{0}$ 

$$-2(x_1^* - \mu_1) = 0$$
  
$$-2(x_2^* - \mu_2) = 0$$

Solving yields  $x_1^* = \mu_1$  and  $x_2^* = \mu_2$ .

### Example 2: Two Dimensional Ideal Points

$$U(\mathbf{x})_i = -(x_1 - \mu_1)^2 - (x_2 - \mu_2)^2$$

Call  $\mu = (\mu_1, \mu_2)$ 

The Hessian at the critical value is

$$\mathbf{H}(f)(\boldsymbol{\mu}) = \begin{pmatrix} \frac{\partial^2 U_i}{\partial x_1 \partial x_1}(\boldsymbol{\mu}) & \frac{\partial^2 U_i}{\partial x_1 \partial x_2}(\boldsymbol{\mu}) \\ \frac{\partial^2 U_i}{\partial x_2 \partial x_1}(\boldsymbol{\mu}) & \frac{\partial^2 U_i}{\partial x_2 \partial x_2}(\boldsymbol{\mu}) \end{pmatrix} \\
= \begin{pmatrix} -2 & 0 \\ 0 & -2 \end{pmatrix}$$

So, -2\*-2-0=4>0 and  $-2<0 \rightsquigarrow$  negative definite, maximum  $\mu=(\mu_1,\mu_2)$  are legislator i's two dimensional ideal point.

Suppose that we draw an independent and identically distributed random sample of n observations from a normal distribution,

Suppose that we draw an independent and identically distributed random sample of n observations from a normal distribution,

$$Y_i \sim \text{Normal}(\mu, \sigma^2)$$

Suppose that we draw an independent and identically distributed random sample of n observations from a normal distribution,

$$Y_i \sim \text{Normal}(\mu, \sigma^2)$$
  
 $\mathbf{Y} = (Y_1, Y_2, \dots, Y_n)$ 

Suppose that we draw an independent and identically distributed random sample of n observations from a normal distribution,

$$Y_i \sim \text{Normal}(\mu, \sigma^2)$$
  
 $\mathbf{Y} = (Y_1, Y_2, \dots, Y_n)$ 

Our task:

Suppose that we draw an independent and identically distributed random sample of n observations from a normal distribution,

$$Y_i \sim \text{Normal}(\mu, \sigma^2)$$
  
 $\mathbf{Y} = (Y_1, Y_2, \dots, Y_n)$ 

#### Our task:

- Obtain likelihood (summary estimator)

Suppose that we draw an independent and identically distributed random sample of n observations from a normal distribution,

$$Y_i \sim \text{Normal}(\mu, \sigma^2)$$
  
 $\mathbf{Y} = (Y_1, Y_2, ..., Y_n)$ 

#### Our task:

- Obtain likelihood (summary estimator)
- Derive maximum likelihood estimators for  $\mu$  and  $\sigma^2$

Suppose that we draw an independent and identically distributed random sample of n observations from a normal distribution,

$$Y_i \sim \text{Normal}(\mu, \sigma^2)$$
  
 $\mathbf{Y} = (Y_1, Y_2, ..., Y_n)$ 

#### Our task:

- Obtain likelihood (summary estimator)
- Derive maximum likelihood estimators for  $\mu$  and  $\sigma^2$
- Characterize sampling distribution

$$L(\mu, \sigma^2 | \mathbf{Y}) \propto \prod_{i=1}^n f(Y_i | \mu, \sigma^2)$$

$$L(\mu, \sigma^{2} | \mathbf{Y}) \propto \prod_{i=1}^{n} f(Y_{i} | \mu, \sigma^{2})$$

$$\propto \prod_{i=1}^{N} \frac{\exp[-\frac{(Y_{i} - \mu)^{2}}{2\sigma^{2}}]}{\sqrt{2\pi\sigma^{2}}}$$

$$L(\mu, \sigma^{2} | \mathbf{Y}) \propto \prod_{i=1}^{n} f(Y_{i} | \mu, \sigma^{2})$$

$$\propto \prod_{i=1}^{N} \frac{\exp\left[-\frac{(Y_{i} - \mu)^{2}}{2\sigma^{2}}\right]}{\sqrt{2\pi\sigma^{2}}}$$

$$\propto \frac{\exp\left[-\sum_{i=1}^{n} \frac{(Y_{i} - \mu)^{2}}{2\sigma^{2}}\right]}{(2\pi)^{n/2} \sigma^{2n/2}}$$

$$L(\mu, \sigma^{2} | \mathbf{Y}) \propto \prod_{i=1}^{n} f(Y_{i} | \mu, \sigma^{2})$$

$$\propto \prod_{i=1}^{N} \frac{\exp\left[-\frac{(Y_{i} - \mu)^{2}}{2\sigma^{2}}\right]}{\sqrt{2\pi\sigma^{2}}}$$

$$\propto \frac{\exp\left[-\sum_{i=1}^{n} \frac{(Y_{i} - \mu)^{2}}{2\sigma^{2}}\right]}{(2\pi)^{n/2} \sigma^{2n/2}}$$

Taking the logarithm, we have

$$L(\mu, \sigma^2 | \mathbf{Y}) \propto \prod_{i=1}^n f(Y_i | \mu, \sigma^2)$$

$$\propto \prod_{i=1}^N \frac{\exp[-\frac{(Y_i - \mu)^2}{2\sigma^2}]}{\sqrt{2\pi\sigma^2}}$$

$$\propto \frac{\exp[-\sum_{i=1}^n \frac{(Y_i - \mu)^2}{2\sigma^2}]}{(2\pi)^{n/2} \sigma^{2n/2}}$$

Taking the logarithm, we have

$$I(\mu, \sigma^2 | \mathbf{Y}) = -\sum_{i=1}^n \frac{(Y_i - \mu)^2}{2\sigma^2} - \frac{n}{2}log(2\pi) - \frac{n}{2}log(\sigma^2) + \mathbf{c}$$

$$L(\mu, \sigma^2 | \mathbf{Y}) \propto \prod_{i=1}^n f(Y_i | \mu, \sigma^2)$$

$$\propto \prod_{i=1}^N \frac{\exp[-\frac{(Y_i - \mu)^2}{2\sigma^2}]}{\sqrt{2\pi\sigma^2}}$$

$$\propto \frac{\exp[-\sum_{i=1}^n \frac{(Y_i - \mu)^2}{2\sigma^2}]}{(2\pi)^{n/2} \sigma^{2n/2}}$$

Taking the logarithm, we have

$$I(\mu, \sigma^{2} | \mathbf{Y}) = -\sum_{i=1}^{n} \frac{(Y_{i} - \mu)^{2}}{2\sigma^{2}} - \frac{n}{2}log(2\pi) - \frac{n}{2}log(\sigma^{2}) + c$$

$$= -\sum_{i=1}^{n} \frac{(Y_{i} - \mu)^{2}}{2\sigma^{2}} - \frac{n}{2}log(\sigma^{2}) + c'$$

## Example 3: Log-Likelihood Plot

 $Y_i \sim \text{Normal}(0.25, 100)$ 

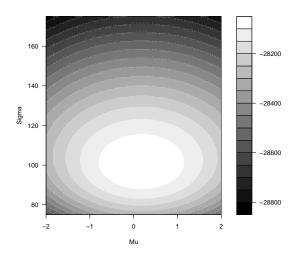

#### Example 3: Log-Likelihood Plot

- In R, drew 10,000 realizations from

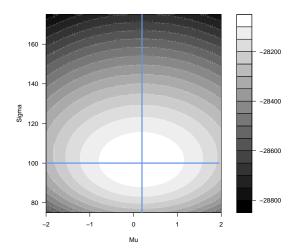

$$Y_i \sim \text{Normal}(0.25, 100)$$

- Used realized values  $y_i$  evaluate  $I(\mu, \sigma^2 | \mathbf{y})$ 

## Example 3: Log-Likelihood Plot

## Example 3: Log-Likelihood Plot

$$I(\mu, \sigma^2 | \mathbf{Y}) = -\sum_{i=1}^n \frac{(Y_i - \mu)^2}{2\sigma^2} - \frac{n}{2} \log(\sigma^2) + \mathbf{c}'$$

$$I(\mu, \sigma^{2} | \mathbf{Y}) = -\sum_{i=1}^{n} \frac{(Y_{i} - \mu)^{2}}{2\sigma^{2}} - \frac{n}{2} \log(\sigma^{2}) + \mathbf{c}'$$

$$\frac{\partial I(\mu, \sigma^{2}) | \mathbf{Y})}{\partial \mu} = \sum_{i=1}^{n} \frac{2(Y_{i} - \mu)}{2\sigma^{2}}$$

$$I(\mu, \sigma^{2} | \mathbf{Y}) = -\sum_{i=1}^{n} \frac{(Y_{i} - \mu)^{2}}{2\sigma^{2}} - \frac{n}{2} \log(\sigma^{2}) + c'$$

$$\frac{\partial I(\mu, \sigma^{2}) | \mathbf{Y})}{\partial \mu} = \sum_{i=1}^{n} \frac{2(Y_{i} - \mu)}{2\sigma^{2}}$$

$$\frac{\partial I(\mu, \sigma^{2}) | \mathbf{Y})}{\partial \sigma^{2}} = -\frac{n}{2\sigma^{2}} + \frac{1}{2\sigma^{4}} \sum_{i=1}^{n} (Y_{i} - \mu)^{2}$$

$$0 = -\sum_{i=1}^{n} \frac{2(Y_{i} - \widehat{\mu})}{2\widehat{\sigma}^{2}}$$
$$0 = -\frac{n}{2\widehat{\sigma}^{2}} + \frac{1}{2\widehat{\sigma}^{4}} \sum_{i=1}^{n} (Y_{i} - \mu^{*})^{2}$$

$$0 = -\sum_{i=1}^{n} \frac{2(Y_{i} - \widehat{\mu})}{2\widehat{\sigma}^{2}}$$

$$0 = -\frac{n}{2\widehat{\sigma}^{2}} + \frac{1}{2\widehat{\sigma}^{4}} \sum_{i=1}^{n} (Y_{i} - \mu^{*})^{2}$$

Solving for  $\widehat{\mu}$  and  $\widehat{\sigma}^2$  yields,

$$0 = -\sum_{i=1}^{n} \frac{2(Y_{i} - \widehat{\mu})}{2\widehat{\sigma}^{2}}$$

$$0 = -\frac{n}{2\widehat{\sigma}^{2}} + \frac{1}{2\widehat{\sigma}^{4}} \sum_{i=1}^{n} (Y_{i} - \mu^{*})^{2}$$

Solving for  $\widehat{\mu}$  and  $\widehat{\sigma}^2$  yields,

$$\widehat{\mu} = \frac{\sum_{i=1}^{n} Y_i}{n}$$

$$0 = -\sum_{i=1}^{n} \frac{2(Y_{i} - \widehat{\mu})}{2\widehat{\sigma}^{2}}$$
$$0 = -\frac{n}{2\widehat{\sigma}^{2}} + \frac{1}{2\widehat{\sigma}^{4}} \sum_{i=1}^{n} (Y_{i} - \mu^{*})^{2}$$

Solving for  $\widehat{\mu}$  and  $\widehat{\sigma}^2$  yields,

$$\widehat{\mu} = \frac{\sum_{i=1}^{n} Y_i}{n}$$

$$\widehat{\sigma}^2 = \frac{1}{n} \sum_{i=1}^{n} (Y_i - \overline{Y})^2$$

$$\mathbf{H}(f)(\widehat{\mu},\widehat{\sigma}^2) = \begin{pmatrix} \frac{\partial^2 l(\mu,\sigma^2|\mathbf{Y})}{\partial \mu^2} & \frac{\partial^2 l(\mu,\sigma^2|\mathbf{Y})}{\partial \sigma^2 \partial \mu} \\ \frac{\partial^2 l(\mu,\sigma^2|\mathbf{Y})}{\partial \sigma^2 \partial \mu} & \frac{\partial^2 l(\mu,\sigma^2|\mathbf{Y})}{\partial^2 \sigma^2} \end{pmatrix}$$

$$\mathbf{H}(f)(\widehat{\mu},\widehat{\sigma}^2) = \begin{pmatrix} \frac{\partial^2 l(\mu,\sigma^2|\mathbf{Y})}{\partial \mu^2} & \frac{\partial^2 l(\mu,\sigma^2|\mathbf{Y})}{\partial \sigma^2 \partial \mu} \\ \frac{\partial^2 l(\mu,\sigma^2|\mathbf{Y})}{\partial \sigma^2 \partial \mu} & \frac{\partial^2 l(\mu,\sigma^2|\mathbf{Y})}{\partial^2 \sigma^2} \end{pmatrix}$$

Taking derivatives and evaluating at MLE's yields,

$$\mathbf{H}(f)(\widehat{\mu},\widehat{\sigma}^2) = \begin{pmatrix} \frac{\partial^2 I(\mu,\sigma^2|\mathbf{Y})}{\partial \mu^2} & \frac{\partial^2 I(\mu,\sigma^2|\mathbf{Y})}{\partial \sigma^2 \partial \mu} \\ \frac{\partial^2 I(\mu,\sigma^2|\mathbf{Y})}{\partial \sigma^2 \partial \mu} & \frac{\partial^2 I(\mu,\sigma^2|\mathbf{Y})}{\partial^2 \sigma^2} \end{pmatrix}$$

Taking derivatives and evaluating at MLE's yields,

$$\mathbf{H}(f)(\widehat{\mu},\widehat{\sigma}^2) = \begin{pmatrix} \frac{-n}{\widehat{\sigma}^2} & 0\\ 0 & \frac{-n}{(\widehat{\sigma}^2)^2} \end{pmatrix}$$

$$\mathbf{H}(f)(\widehat{\mu},\widehat{\sigma}^2) = \begin{pmatrix} \frac{\partial^2 I(\mu,\sigma^2|\mathbf{Y})}{\partial \mu^2} & \frac{\partial^2 I(\mu,\sigma^2|\mathbf{Y})}{\partial \sigma^2 \partial \mu} \\ \frac{\partial^2 I(\mu,\sigma^2|\mathbf{Y})}{\partial \sigma^2 \partial \mu} & \frac{\partial^2 I(\mu,\sigma^2|\mathbf{Y})}{\partial^2 \sigma^2} \end{pmatrix}$$

Taking derivatives and evaluating at MLE's yields,

$$\mathbf{H}(f)(\widehat{\mu},\widehat{\sigma}^2) = \begin{pmatrix} \frac{-n}{\widehat{\sigma}^2} & 0\\ 0 & \frac{-n}{(\widehat{\sigma}^2)^2} \end{pmatrix}$$

$$\det(\mathbf{H}(f)(\widehat{\mu},\widehat{\sigma}^2)) = n^2/\widehat{\sigma}^5$$
 and  $-n/\widehat{\sigma}^2 < 0 \rightsquigarrow \text{maximum}$

 $r_{ij}$  =Indicator, Document i assigned to cluster j

$$\mathbf{r}_{j} = (\mathbf{r}_{1j}, \mathbf{r}_{2j}, \dots, \mathbf{r}_{Nj})$$
  
 $\mathbf{r} = (\mathbf{r}_{1}^{'}, \mathbf{r}_{2}^{'}, \dots, \mathbf{r}_{K}^{'}) (N \times K \text{ matrix})$ 

2) For each cluster j

 $\mu_i$  a cluster center for cluster j.

$$\boldsymbol{\mu}_j = (\mu_{1j}, \mu_{2j}, \dots, \mu_{Mj})$$

Notation. Representation of document *i*:

$$\mathbf{y}_i = (y_{i1}, y_{i2}, \dots, y_{iM})$$

- 1) Assume Euclidean distance between objects.
- 2) Objective function

$$f(\boldsymbol{r}, \boldsymbol{\mu}, \boldsymbol{y}) = \sum_{i=1}^{N} \sum_{j=1}^{K} r_{ij} \left( \sum_{m=1}^{M} (y_{im} - \mu_{km})^{2} \right)$$

- 1) Assume Euclidean distance between objects.
- 2) Objective function

$$f(\boldsymbol{r}, \boldsymbol{\mu}, \boldsymbol{y}) = \sum_{i=1}^{N} \sum_{j=1}^{K} r_{ij} \left( \sum_{m=1}^{M} (y_{im} - \mu_{km})^{2} \right)$$

Goal:

- 1) Assume Euclidean distance between objects.
- 2) Objective function

$$f(\mathbf{r}, \boldsymbol{\mu}, \mathbf{y}) = \sum_{i=1}^{N} \sum_{j=1}^{K} r_{ij} \left( \sum_{m=1}^{M} (y_{im} - \mu_{km})^{2} \right)$$

Goal:

Choose  ${m r}^*$  and  ${m \mu}^*$  to minimize  $f({m r},{m \mu},{m y})$ 

- 1) Assume Euclidean distance between objects.
- 2) Objective function

$$f(\mathbf{r}, \boldsymbol{\mu}, \mathbf{y}) = \sum_{i=1}^{N} \sum_{j=1}^{K} r_{ij} \left( \sum_{m=1}^{M} (y_{im} - \mu_{km})^{2} \right)$$

Goal:

Choose  $r^*$  and  $\mu^*$  to minimize  $f(r, \mu, y)$ 

Two observations:

- If K = N  $f(r^*, \boldsymbol{\mu}^*, \boldsymbol{y}) = 0$  (Minimum)
  - Each observation in own cluster
  - $\boldsymbol{\mu}_i = \boldsymbol{y}_i$
- If K=1,  $f(r^*, \boldsymbol{\mu}^*, \boldsymbol{y}) = N \times \sigma^2$ 
  - Each observation in one cluster
  - Center: average of documents

- 1) Assume Euclidean distance between objects
- 2) Objective function
- 3) Algorithm for optimization

Iterative algorithm, Each Iteration t

- Conditional on  $\mu^{t-1}$  (from previous iteration), choose  $r^t$
- Conditional on  ${m r}^t$ , choose  ${m \mu}^t$

Repeat until convergence, measured as change in f.

Change = 
$$f(\boldsymbol{\mu}^t, \boldsymbol{r}^t, \boldsymbol{y}) - f(\boldsymbol{\mu}^{t-1}, \boldsymbol{r}^{t-1}, \boldsymbol{y})$$

$$f(\mathbf{r}, \boldsymbol{\mu}, \mathbf{y}) = \sum_{i=1}^{N} \sum_{j=1}^{K} r_{ij} \left( \sum_{m=1}^{M} (y_{im} - \mu_{km})^{2} \right)$$

Algorithm for estimation:

Begin: initialize  $\mu_1^{t-1}, \mu_2^{t-1}, \dots, \mu_K^{t-1}$ Choose  $r^t$ 

$$r_{ij}^t = \begin{cases} 1 \text{ if } j = \arg\min_k \sum_{m=1}^M (y_{im} - \mu_{km})^2 \\ 0 \text{ otherwise }, \end{cases}$$

In words: Assign each document  $y_i$  to the closest center  $\mu_k$ 

$$f(\mathbf{r}, \boldsymbol{\mu}, \mathbf{y}) = \sum_{i=1}^{N} \sum_{j=1}^{K} r_{ij} \left( \sum_{m=1}^{M} (y_{im} - \mu_{km})^{2} \right)$$

Conditional on  ${m r}^t$ , choose  ${m \mu}^t$ Let's focus on  ${m \mu}_k$ 

$$f(\mathbf{r}, \boldsymbol{\mu}_k, \mathbf{y})_k = \sum_{i=1}^N r_{ik} \left( \sum_{m=1}^M (y_{im} - \mu_{km})^2 \right)$$

Focus on just  $\mu_{km}$ 

$$f(\mathbf{r}, \mu_{km}, \mathbf{y})_{km} = \sum_{i=1}^{N} r_{ik} (y_{im} - \mu_{km})^2$$

Quadratic: take derivative, set equal to zero (second derivative test works)

$$\frac{\partial f(\mathbf{r}, \mu_{km}, \mathbf{y})_{km}}{\partial \mu_{km}} = -2 \sum_{i=1}^{N} r_{ik} (y_{im} - \mu_{km})$$

$$2 \sum_{i=1}^{N} r_{ik} (y_{im} - \mu_{km}^{t}) = 0$$

$$\sum_{i=1}^{N} r_{ik} y_{im} - \mu_{km}^{t} \sum_{i=1}^{N} r_{ik} = 0$$

$$\frac{\sum_{i=1}^{N} r_{ik} y_{im}}{\sum_{i=1}^{N} r_{ik}} = \mu_{km}^{t}$$

$$\boldsymbol{\mu}_k^t = \frac{\sum_{i=1}^N r_{ik} \boldsymbol{y}_i}{\sum_{i=1}^N r_{ik}}$$

#### In words:

-  $\mu_k^t$  is the average of documents assigned to the  $k^{\text{th}}$  cluster

#### Algorithm, In Words

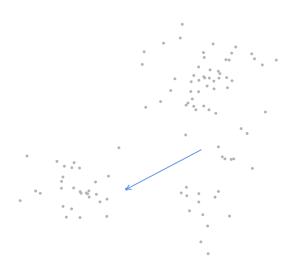

- Conditional on center estimates, assign documents to closest cluster centers
- Conditional on document assignments, cluster centers are averages of documents assigned to the cluster

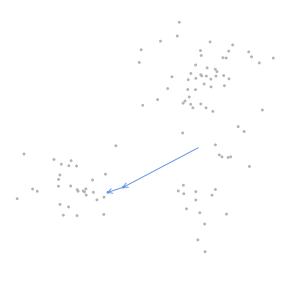

#### Expectation-Maximization (EM) [connection guarantees convergence]

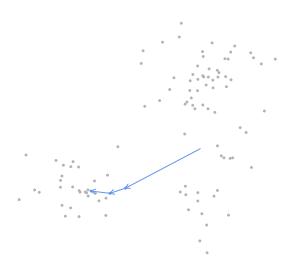

- Estimation of  $r \rightsquigarrow$  Expectation step (data augmentation)
- Estimation of  $\mu_k \rightsquigarrow \mathsf{Maximization}$  Step

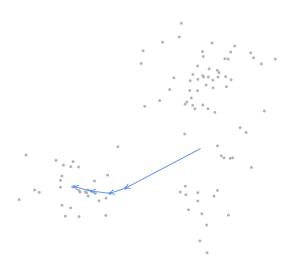

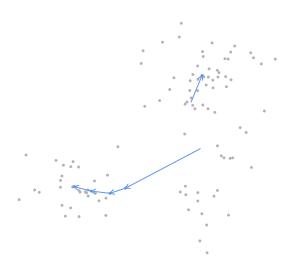

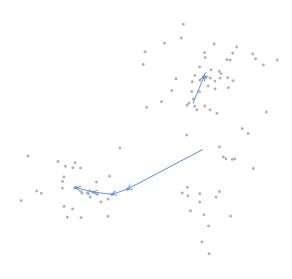

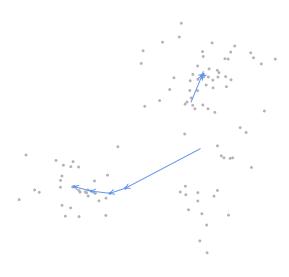

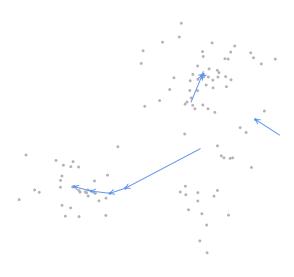

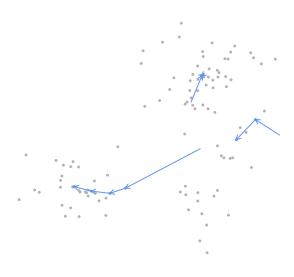

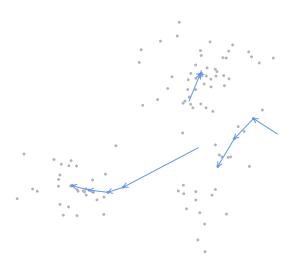

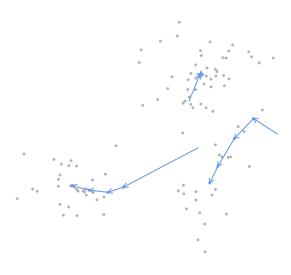

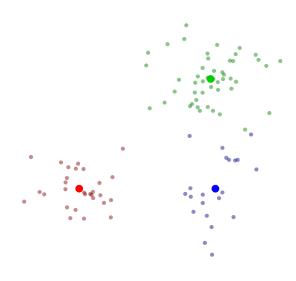

Nelder Mead:

#### Nelder Mead:

- Evaluate points on a simplex (triangle)

#### Nelder Mead:

- Evaluate points on a simplex (triangle)
- Either Reflect, Expand, or Contract (based on values)

#### Nelder Mead:

- Evaluate points on a simplex (triangle)
- Either Reflect, Expand, or Contract (based on values)
- Converges to local extrema

#### Nelder Mead:

- Evaluate points on a simplex (triangle)
- Either Reflect, Expand, or Contract (based on values)
- Converges to local extrema

Stochastic Optimization:

#### Nelder Mead:

- Evaluate points on a simplex (triangle)
- Either Reflect, Expand, or Contract (based on values)
- Converges to local extrema

#### Stochastic Optimization:

- Sample a subset of data, perform optimization

#### Nelder Mead:

- Evaluate points on a simplex (triangle)
- Either Reflect, Expand, or Contract (based on values)
- Converges to local extrema

#### Stochastic Optimization:

- Sample a subset of data, perform optimization
- Sample a new subset, perform optimization, combine with previous sample

#### Nelder Mead:

- Evaluate points on a simplex (triangle)
- Either Reflect, Expand, or Contract (based on values)
- Converges to local extrema

#### Stochastic Optimization:

- Sample a subset of data, perform optimization
- Sample a new subset, perform optimization, combine with previous sample
- Converges on local extrema (given regulatory conditions)

#### Nelder Mead:
